SUMMARY

Fullstack developer working in TypeScript and JavaScript. Over the past year and a half I have built four commercial projects: a payroll system, a lead collection service, a desktop SEO audit app and a Telegram bot with a Mini App. I usually take a project end to end: I design the database, write the backend and UI, set up deployment and support it in production. I also lead an engineering team at a service center, so I am used to gathering requirements and explaining technical decisions to people outside IT.

SKILLS

Programming: TypeScript, JavaScript, HTML5, CSS3
Frontend: React 19, Next.js 16, Vue.js, Tailwind CSS, TanStack Query, Electron, Telegram Mini Apps
Backend: Node.js 22, Express 5, Fastify, REST API, Zod, auth and roles, Telegram bots (grammY)
Databases: PostgreSQL, MongoDB (Mongoose), SQLite, Prisma, Drizzle ORM
Tools: Git, Docker Compose, Caddy, CI/CD, Vitest, Playwright, node:test

DEVELOPMENT EXPERIENCE

Fullstack Developer

Sep 2026 - Oct 2026

Commercial project · AI Search & SEO Intelligence Platform

A Windows desktop app for technical SEO audits, content analysis and checking how visible a site is in AI search. All data stays on the user's computer.

- Wrote a TypeScript monorepo of about 130k lines: crawler, SEO rules engine, competitor comparison, recommendations and scheduled checks.
- Built 64 SEO rules and an overall 0–100 score that shows how many points each rule takes off.
- Used AI only where code alone wasn't enough. Ambiguous audit results are classified by the Jev model (TypeSafe AI), while OpenAI writes text summaries and never touches measured data.
- On 10,000-page sites the UI froze for up to 12.8 seconds. I moved the audit into a separate thread and rewrote the heavy database queries, and the freezes went away.
- Hardened Electron (sandbox, strict CSP, SSRF protection, encrypted API keys), integrated Google Search Console, OpenAI and WordPress, wrote 668 tests and built the installer.

Stack: TypeScript, Electron, React 19, Tailwind CSS, TanStack Query, Zod, Recharts, SQLite (libSQL), Drizzle ORM, Cheerio, Playwright, Vitest

Fullstack Developer

Sep 2026 - Oct 2026

Commercial project · Telegram bot for paying foreign services

An invite-only bot. Clients submit requests to pay for foreign services, and the bot calculates the price in rubles and keeps track of balances, subscriptions and reminders. It never stores card details.

- Built the whole request flow: pricing at the Central Bank rate plus markup, payment confirmation and reconciliation against the actual charge. The difference goes to the client's balance automatically.
- Balances come from a ledger that can't be edited after the fact, enforced by a database trigger. Amounts are stored in minor units, and row locks stop the same balance from being spent twice.
- Wrote a Telegram Mini App in React. The server checks the Telegram signature and the user's permissions on every request.
- Gift card codes are encrypted with AES-256-GCM and deleted after 7 days. Payment details never reach the database or the logs.
- Deployed it with Docker Compose: PostgreSQL, daily backups with restore checks, and Caddy for HTTPS.

Stack: Node.js, TypeScript, grammY, Fastify, PostgreSQL, Prisma, Zod, React, Vite, Vitest, Docker, Caddy

Fullstack Developer Jul 2026 – Aug 2026

Commercial project · lead collection service

The service collects leads from public and private sources, picks the relevant ones and sends notifications to Telegram. A CRM feed is used to work with them.

- Wrote more than half of the code: source integrations, selection and scoring rules, the CRM feed, the Telegram bot and CI/CD. Supported the service in production.
- Some platforms have no API or RSS. Instead of a headless browser, I took the data from the JSON already embedded in the page HTML, which cut memory usage and server costs.
- Found why relevant leads were being lost: the service confused “no budget given” with “price negotiable”. I separated the two cases and checked the fix on a sample of real orders.
- Rewrote the keyword filter with word-boundary regular expressions so short words no longer matched inside longer ones.
- Leads that can’t be answered (paid subscription, hidden phone number) go into statistics but don’t trigger notifications.
- Wrote E2E tests that run the scrapers against live sites, so we notice layout changes before users do.
- Moved notification thresholds from environment variables into the UI settings and added a calculator that shows how many leads the new values will bring.

Stack: Node.js 22, TypeScript, Next.js 16 (React 19), Prisma 7, SQLite (WAL), Zod, grammY, node:test, Docker Compose

Fullstack Developer Mar 2025 – May 2025

Commercial project · payroll system for a small electronics manufacturer

A web app that calculates employee pay for a small manufacturing business. Built from scratch.

- Wrote the payroll module: it combines position rates, monthly bonuses, deductions and taxes.
- Moved taxes into a separate entity, so rates can be changed in the UI without touching the code.
- Added admin and employee roles with permission checks at the API level, plus session-based login (express-session, connect-mongo, bcrypt).
- Every calculation is saved to history in full, so past payments don’t change when rates do.
- Wrote the UI in plain JavaScript: tables update without reloading the page.

Stack: Node.js, Express 5, MongoDB, Mongoose, JavaScript, REST API, express-session, bcryptjs, HTML5, CSS3

OTHER EXPERIENCE

Engineering Team Lead Aug 2025 - Oct 2026

Orig-Service, electronics service center

- Lead the service center’s engineers: assign tasks, run daily stand-ups, keep an eye on repair deadlines and quality.
- Audited the process from device intake to handover and introduced procedures and checklists. Downtime and repeat repairs went down.
- Write requirements and logic for internal automation tools and hand them to developers.

EDUCATION

IMSIT — Academy of Marketing and Social Information Technologies 2025

Vocational diploma · Information Systems and Programming, qualification: Programmer

LANGUAGES

Russian — native · English — B1 (Intermediate)
